

# portal phylogenies.Rmd

Jai Jot Kaur

10/25/2022

## Add an intro to the newick format

A newick file is a text file that demonstrates a representation for a phylogenetic tree. This text file allows the easy accessibility and reading of the tree by the computer. An inner node is represented by a pair of paranthesis, a tip is represented by names or character stringgs, a lineage is represented by a comma which also allwos separation of the nodes and tups, and, finally, the semicolon is representative of the end of the tre; therefore, multiple semicolons in a newick file may represent multiple trees. This is useful as image files for the data are not able to be read by a cimputer, so a text file, such as the nwick file, is necessary for the computer to easily read the file

## The package ‘ape’

```
# install.packages("ape")
library(ape)
```

To read a newick tree from a local file:

```
portal_tree <- read.tree("../data-raw/portal-tree.tre")
portal_tree
```

```
##
## Phylogenetic tree with 43 tips and 42 internal nodes.
##
## Tip labels:
##   Sigmodon_ochrognathus, Sigmodon_hispidus, Sigmodon_fulviventer, Neotoma_albigula, Onychomys_torridus
## Node labels:
##   Amniota, mrcaott42ott29157, mrcaott42ott10477, mrcaott42ott48903, mrcaott739ott15637, mrcaott39197
##
## Rooted; no branch lengths.
```

Read a newick from a URL

```
small_tree <- read.tree(file = "http://ape-package.ird.fr/APER/APER2/primfive.tre")
small_tree
```

```
##
## Phylogenetic tree with 5 tips and 4 internal nodes.
##
## Tip labels:
##   Homo, Pongo, Macaca, Ateles, Galago
##
## Rooted; includes branch lengths.
```

## The structure of a tree in R

An extension of ggplot for phylogenetic visualization: **ggtree** To install packages from the Bioconductor repo, we need a CRAN package called BiocManager

```
# install.packages("Biocmanager")
library(BiocManager)
# install("ggtree")
library(ggtree)
```

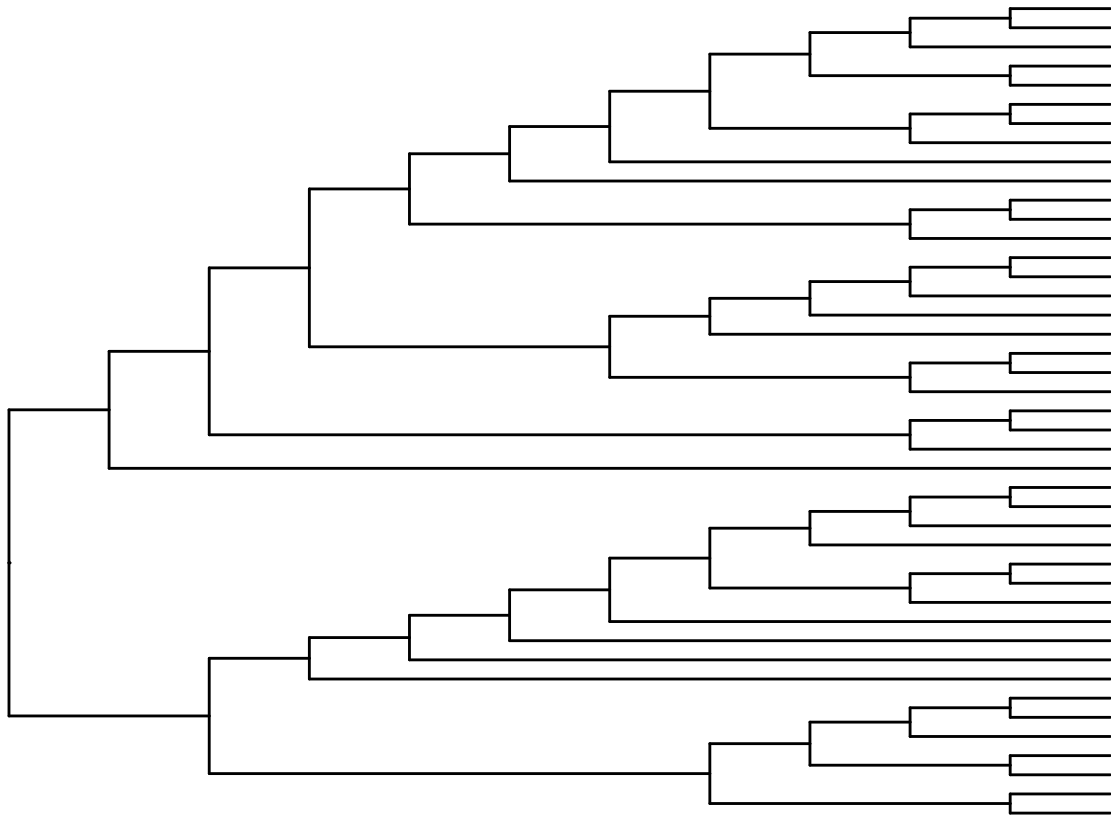

```
## ggtree v3.4.4 For help: https://yulab-smu.top/treedata-book/

## Add tip labels and node labels

Because a plot is nothing with no labels:

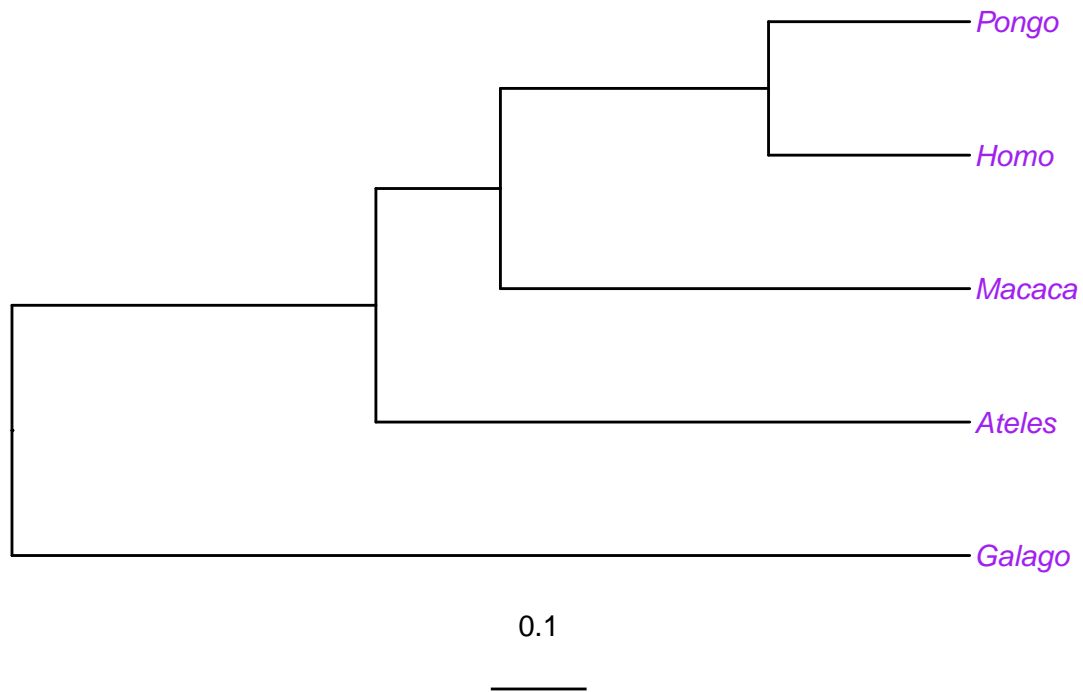

```
ggtree(portal_tree) +  
  geom_treescale() +  
  geom_tiplab(size = 1, color = "purple", fontface = "italic")
```

Add a limit to the plot so we can see the labels fully:

```
ggtree(portal_tree) +  
  geom_treescale() +  
  geom_tiplab(size = 1, color = "purple", fontface = "italic") +  
  xlim(NA, 200)
```

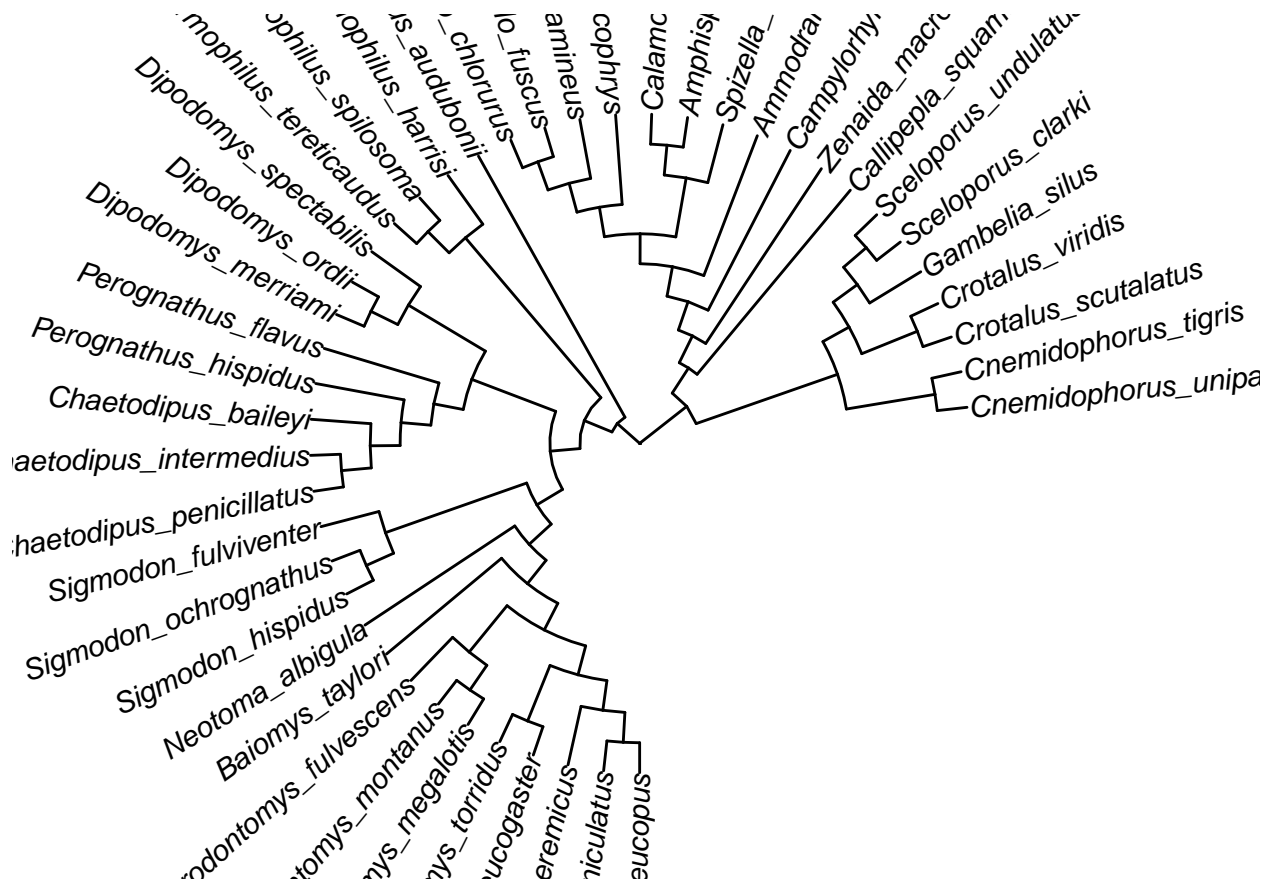

```
ggtree(portal_tree, layout = "fan", open.angle = 90) +  
  geom_tiplab(fontface = "italic")
```

```
## Scale for 'y' is already present. Adding another scale for 'y', which will  
## replace the existing scale.
```

```
# install.packages("aplot")
```

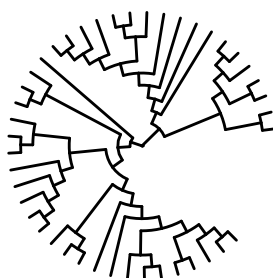

```
library(aplot)
```

```
ggtree(portal_tree, layout = "fan", open.angle = 45) -> plot1
```

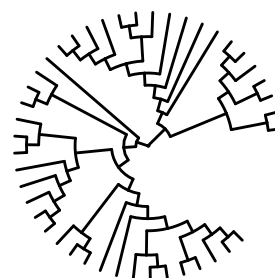

```
## Scale for 'y' is already present. Adding another scale for 'y', which will
## replace the existing scale.
```

```
plot_list(plot1, plot1, labels = c("Circular Tree of Portal Species", "The same"), tag_size = 10)
```

Circular Tree of Portal Species

The same

Part 1:

```
# install.packages("igraph")

```

```
## Average angle change [2] 0.0256734307087878
```

Part 2: Create a subplot for each tree.

```
plot_list(p1,p2,p3,p4,p5,p6,p7,p8,p9,p10,p11,p12, tag_levels = "a")
```

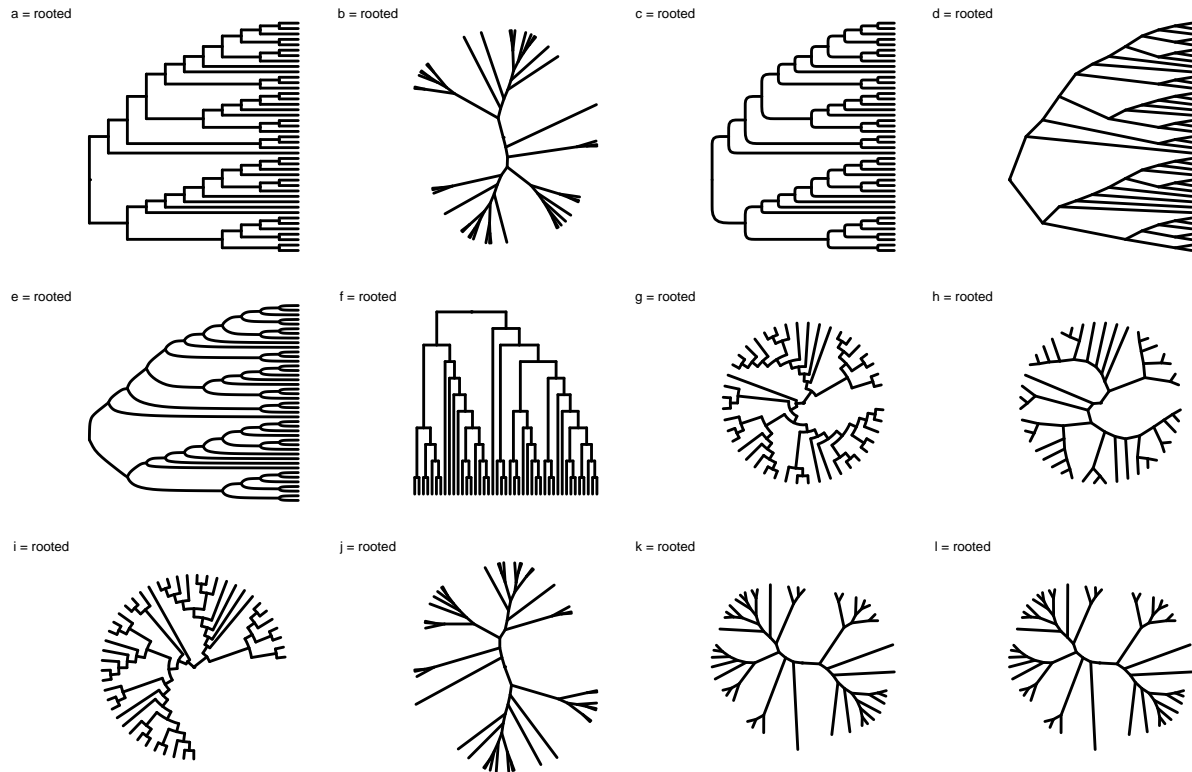

Part 3: Is the tree representation rooted or unrooted

```
# create a vector of labels for my 12 plots:
my_labels <- paste(letters[1:12], "=", "rooted")
my_labels
```

```
## [1] "a = rooted" "b = rooted" "c = rooted" "d = rooted" "e = rooted"
## [6] "f = rooted" "g = rooted" "h = rooted" "i = rooted" "j = rooted"
## [11] "k = rooted" "l = rooted"
```

```
plot_list(p1,p2,p3,p4,p5,p6,p7,p8,p9,p10,p11,p12,
          labels = my_labels, tag_size = 5)
```

## Connecting a phylogeny with data from a table

```
taxonomy <- read.csv("../data-raw/portal-species-taxonomy.csv")
surveys <- read.csv("../data-raw/surveys.csv")
species <- read.csv("../data-raw/species.csv")
```

```
intersect(colnames(species), colnames(surveys))
```

```
## [1] "species_id"
```

```
library(dplyr)
```

```
##
```

```
## Attaching package: 'dplyr'
```

```
## The following objects are masked from 'package:stats':
```

```
##

## Exercise - homework

Exercise: A taxonomy table for `small_tree` Find the appropriate scientific group labels for each genus in `small_tree` using this tree as guide. Create a data frame with 3 columns: a “label” column with the names of the tip labels of `small_tree`. Tip: extract the element “tip.label” from your phylo object to get a vector of tip labels that you can then join to the other vectors to create a data frame. a “taxa” column with the scientific names of the group that each genus belongs to. a “common\_name” column with the common names of the group that each genus belongs to. Tip: use the function `c()` to create the vectors that will be columns “taxa” and “common\_name” Join your tree and your table using `left_join()`. Create two different tree plots using taxa and common name to color the tips of the tree.

```
small_tree <- read.tree(file = "http://ape-package.ird.fr/APER/APER2/primfive.tre")
branching.times(small_tree)
```

```
##      6      7      8      9
## 1.00 0.62 0.49 0.21
```

```
ggtree(small_tree) +
  xlim(0,1.5) +
  geom_tiplab(fontface = "italic")
```

```
label <- small_tree$tip.label
taxa <- c("Hominini", "Ponginae", "Cercopithecoidea", "Platyrrhini", "Lorisoidea")
common_name <- c("Human", "Orangutan", "Macaques", "Spider Monkey", "Lesser Bushbaby")
```

```
data.frame(label, taxa, common_name)
```

```
##   label      taxa      common_name

```

Exercise: Mapping weight data from surveys CSV table to the portal tree 1. Get the average weight and hindfoot length per species. 2. Create a new data frame that contains the taxonomy data plus the averaged data per species that you got on last question. 3. Create two plots with data on the tips, one with the average weight and the other with average hindfoot length. Make sure to also add tip labels, formatted in italics.

```
library(dplyr)
colnames(surveys)
```

```
## [1] "record_id"      "month"          "day"           "year"
