## The Portal Project Teaching Dataset

It is an ecological experiment made in the Chihuahuan deser in Arizona near the city of Portal

Later I will add a picture of the Chihuahuan desert <https://www.google.com/url?sa=i&url=https%3A%2F%2Fwww.desertusa.com%2Fchihuahuan-desert.html&psig=AOvVaw1ccqb81iiGHfvmvPe9xZXL&ust=1665611083984000&source=images&cd=vfe&ved=0CAwQjRxqFwoTCPj2uP2S2foCFQAAAAAdAAAAABAD>

For all the data manipulations we are going to be using the “dplyr” package.

To install packages we use the function ‘install\_packages()’: But to use the functions inside a package, we need to load them to our environment, we do this with the function ‘library()’.

```
library(dplyr)
```

```
##
## Attaching package: 'dplyr'

## The following objects are masked from 'package:stats':
##
##   filter, lag

## The following objects are masked from 'package:base':
##
##   intersect, setdiff, setequal, union
```

## Read the data table

```
surveys <- read.csv(file = "../data-raw/surveys.csv")
head(surveys)
```

```

## Subset a data table

Using the dplyr function 'subset()' :

```
# select(surveys, year, species_id, weight)
# surveys_short <- select(surveys, year, species_id, weight)
# head(surveys_short)
```

Other ways to subset a data table:

```
columns2keep <- c("year", "species_id", "weight")
surveys[, "year"]
```

```

## Add columns to a data table

We can use the function 'mutate()'

Let's say that we want to add on extra column that has weight divided by 10

Using the classic approach

```
colnames(surveys)
```

```
## [1] "record_id"      "month"          "day"            "year"
## [5] "plot_id"        "species_id"     "sex"            "hindfoot_length"
## [9] "weight"
```

```
surveys$weight_decimal <- surveys$weight/10
```

```
colnames(surveys)
```

```
## [1] "record_id"      "month"          "day"            "year"
## [5] "plot_id"        "species_id"     "sex"            "hindfoot_length"
## [9] "weight"         "weight_decimal"
```

```
# surveys <- mutate(surveys, weight_decimal_2 = weight/10)
```

```
surveys
```

```
##      record_id month day year plot_id species_id sex hindfoot_length weight

## Rearrange/reorder a data table by some value

We will use the function `'arrange()'`

```
# surveys_arranged <- arrange(surveys, weight)

# tail(surveys_arranged, 100)
```

To arrange in descending order

```
# arrange(surveys, desc(weight))
```

## Filter data

To filter unwanted data or by some specific value in our data we use the function ‘filter()’

```
# filter(surveys, species_id == "DS")
# filter(surveys, species_id != "DS")
```

We can also filter by multiple conditions:

```
# temp_table <- filter(surveys, species_id == "DS", year >= "1998")
# tail(temp_table, 100)
```

The logical operator ‘&’ and ‘|’ mean “AND” and “OR”

```
# filter(surveys, species_id == "DS" & year >= "1998")
```

```
# filter(surveys, species_id == "DS" | year >= "1998")
```

Let’s filter for values that are NA, we need the function ‘is.na’

```
# is.na(surveys)
# surveys$weight
# filter(surveys, !is.na(weight))
```

## Load surveys.csv into R using read.csv().

```
surveys <- read.csv(file = "../data-raw/surveys.csv")
```

Use select() to create a new data frame object with just the year, month, day, and species\_id columns in that order.

```
surveys_new <- select(surveys, year, month, day, species_id)
```

Use `mutate()`, `select()`, and `filter()` with `!is.na()` to create a new data frame with the year, species\_id, and weight in kilograms of each individual, with no null weights. The weight in the table is given in grams so you will need to create a new column for weight in kilograms by dividing the weight column by 1000.

```
surveys_subset <- filter(surveys, !is.na(weight))
surveys_subset <- mutate(surveys_subset, weight_kg = weight/1000)
surveys_subset <- select(surveys_subset, year, species_id, weight_kg)
filter(surveys_subset, species_id == "SH")
```
